

Living With Fire

Fuel Management Terms for Homeowners

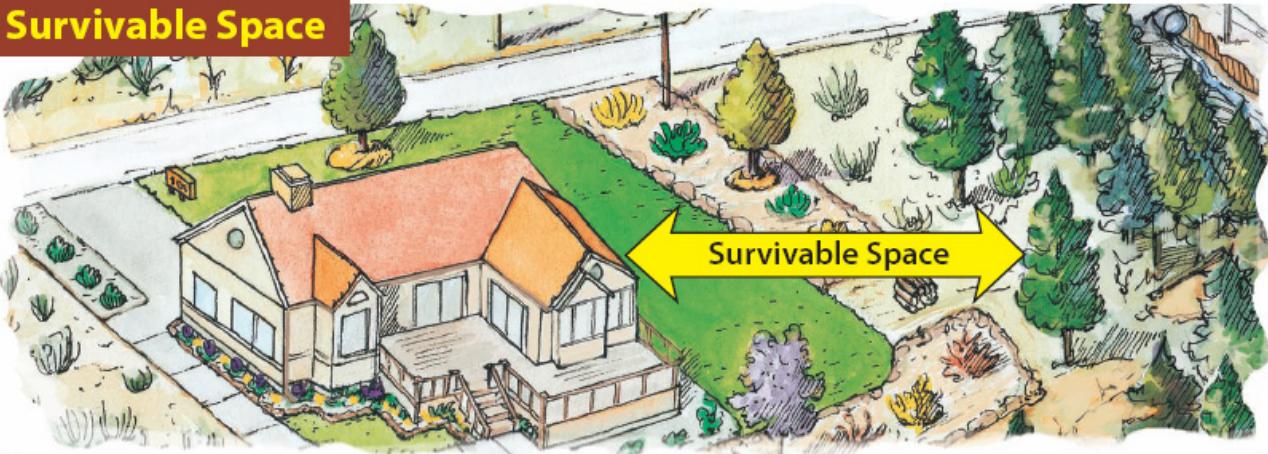

Ed Smith, Natural Resource Specialist
University of Nevada Cooperative Extension

Defensible Space

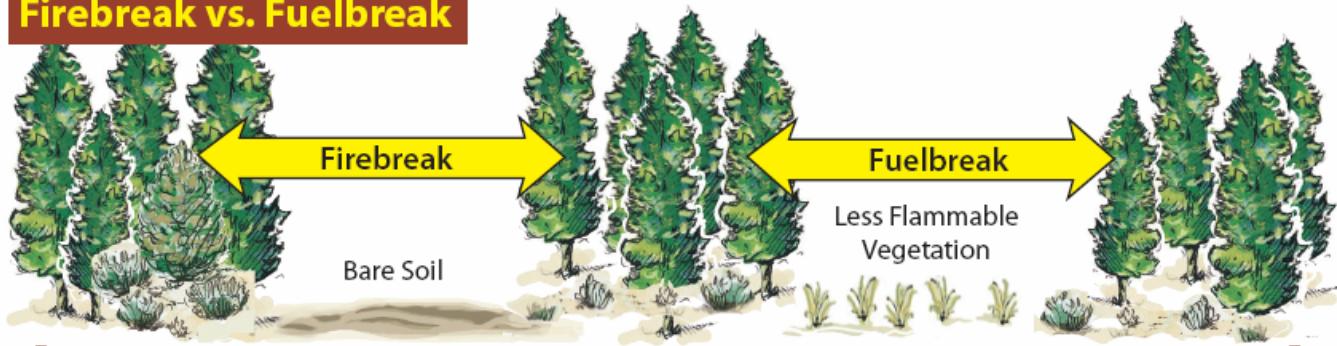

"Defensible space" is an area between a house and an oncoming wildfire where the vegetation has been managed to reduce the wildfire threat and allow firefighters to safely defend the house.

Survivable Space

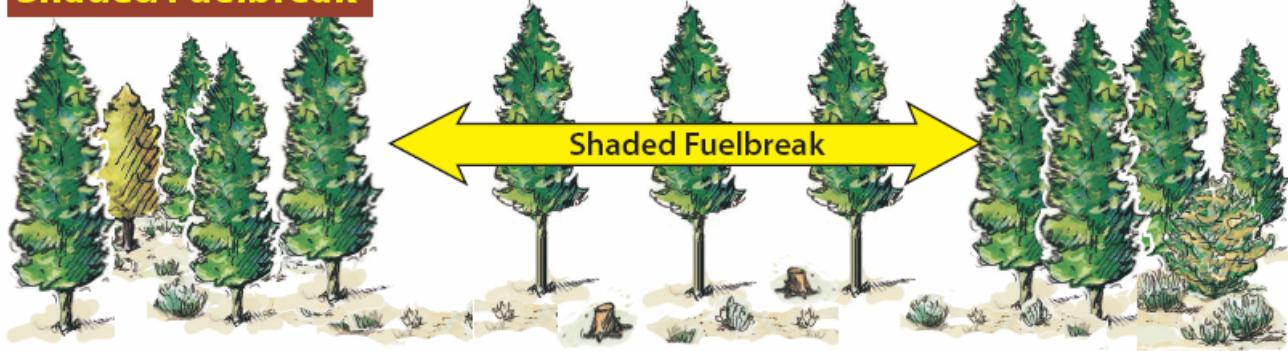

"Survivable space" is similar in concept to defensible space, except it emphasizes the house surviving a wildfire without significant firefighter or homeowner assistance.

Firebreak vs. Fuelbreak

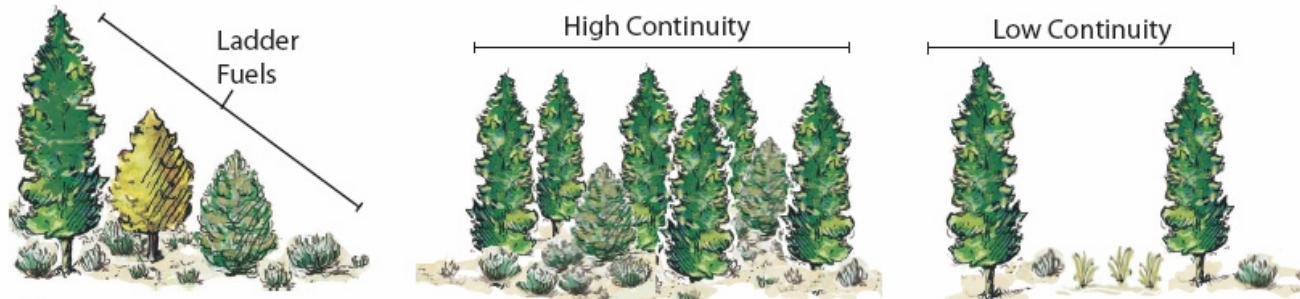

Some sources consider the terms firebreak and fuelbreak as synonymous, while others differentiate between the terms. For the later group, a **firebreak** is an opening or strip of land where vegetation is absent and bare soil is usually present, and it is effective in preventing the spread of wildfire. Firebreaks can be naturally occurring (e.g., rivers and rock outcrops) or manmade. A **fuelbreak** is a strip of land where flammable vegetation has been removed and less hazardous vegetation is retained.

Shaded Fuelbreak

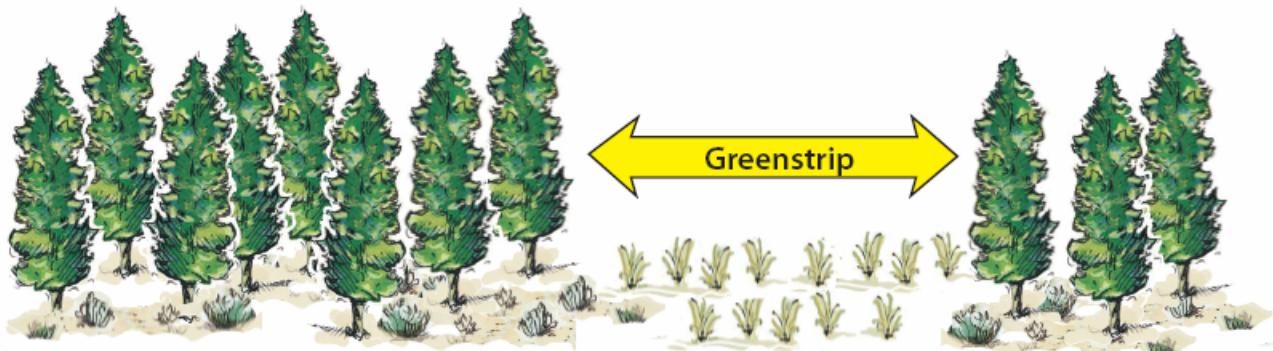

This is a type of fuelbreak in forested areas where the trees have been thinned, tree canopies have been raised through removal of lower branches, and the understory vegetation has been managed to reduce the fire threat.

Ladder Fuels and Continuity

Vegetation that would allow a fire to ignite taller vegetation, such as tree branches, is referred to as "ladder fuel." "Continuity" refers to the uniformity and density of fuels. Plants that are growing close together with little open space between them have "high continuity" and are a fire hazard. Vegetation that is sparse and widely separated has "low continuity" and is less of a threat.

Greenstrips

A "greenstrip" is a strip of land where fire-resistant vegetation has been planted to reduce the wildfire threat. Crested wheatgrass is often planted in Nevada greenstrips.
